New hybrid protein chaperone (e.g. heat shock protein) useful for stabilizing proteins and/or protein activities, or as an agent to prevent protein aggregation, or for treating diseases involving altered protein

Disclosure; Fig 11; 45pp; English.

The invention relates to a hybrid protein chaperone for stabilising proteins and/or protein activities. Protein chaperones (also known as heat shock proteins) are divided into 4 families on the basis of their primary sequence and chaperone properties: HSP90, HSP70, HSP60 and sHSP (small heat shock protein). The invention is based upon the finding that among the sHSP family, which have a general structure of a central domain (called the alpha-crystallin domain) flanked by N and C-terminal regions. regions o H

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC region from a second sHSP can improve the activity compared to native CC sHSPs. In a particual embodiment of the invention, the hybrid chaperone CC is a hybrid sHSP designated alphas-HSP2 comprising the N-terminus and CC central portion of alphas-crystallin and the C-terminal tail of HSP27. CHowever, the hybrid protein chaperones of the invention can comprise regions from HSP90, HSP70 and HSP60 families as well as from the SHSP CC regions from HSP90, HSP70 and HSP60 families as well as from the SHSP CC such as enzymes, therapuetic proteins, diagnostic proteins, reporter proteins or antibodies, their fragments or conjugates in an aqueous comprising at least one protein chaperones; stabilised protein formulation CC comprising at least one protein associated with the above hybrid protein Cc chaperone; nucleic acids and vectors encoding a hybrid protein chaperone; cc and the coexpression of a recombinant protein of interest and a hybrid protein protein adgregation, as inhibitors of cell death and genome CC protein chaperone. The hybrid protein sthat are in the C process of unfolding, for the treatment of diseases involving altered CC protein conformations (e.g., cardiomyopathies, cataracts or neurodegenerative disease), or for the manufacture of a medicament for the treatment of such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The tryptophan residues in the polypeptide are less solvent accessible as compared to those of eye lens crystallins alpha A and alpha B. The polypeptide shows extraordinarily high chaperone-like activity ranging between 3 - 6 times that of the eye lens crystallins alpha A and alpha B. The present sequence represents the amino acid sequence of the human alpha BNAC crystallin chimeric protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a chimera alpha BNAC polynucleotide that encodes a chimeric alpha BNAC polypeptide. The polypeptide is useful for preventing protein aggregation. The polypeptide is also useful for increasing the shelf life of proteins of pharmaceutical value. The polypeptide shows an increase in accessible hydrophobic regions, forms

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid that is a 5' expressed sequence tag (5' EST) 1 obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and diagnostic, forensic, gene therapy and chromosome mapping proce

The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed medication but was obtained in alcottories.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention discloses a composition comprising two or more isolated or human polynucleotides or a polynucleotide which represents a fragme derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a which is differentially regulated in an animal subjected to pain and a sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        which is differentially regulated in an amount for identifying an agent kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of a first animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-AUG-2001; 2001US-0312147P.

stabilizing proteins and/or protein activities, or as an agent to preve protein aggregation, or for treating diseases involving altered protein New hybrid protein chaperone (e.g. heat shock protein) useful for to prevent

Disclosure; Fig 11; 45pp; English

CC replacement of one or more regions of an sHSP with the corresponding CC region from a second sHSP can improve the activity compared to native SHSPs. In a particualr embodiment of the invention, the hybrid chaperone is a hybrid sHSP designated alphaB-HSP27 comprising the N-terminus and CC central portion of alphaB-crystallin and the C-terminal tail of HSP27. CC However, the hybrid protein chaperones of the invention can comprise regions from HSP90, HSP70 and HSP60 families as well as from the sHSP CC such as enzymes, therapuetic proteins, diagnostic proteins, reporter CC such as enzymes, therapuetic proteins, diagnostic proteins, reporter CC such as enzymes, therapuetic proteins, diagnostic proteins raducous conjugates in an aqueous conjugates in an aqueous conjugates in an aqueous comprising at least one protein chaperones; stabilised protein formulation chaperone; nucleic acids and vectors encoding a hybrid protein chaperone; conduction associated with the above hybrid protein chaperone; nucleic acids and vectors encoding a hybrid protein chaperone; con the coexpression of a recombinant protein of interest and a hybrid protein protein aggregation, as inhibitors of cell death and genome compromed the complex of the treatment of diseases involving altered comproment protein conformations (e.g., cardiomyopathies, cataracts or neurodegenerative diseases), or for the manufacture of a medicament for the treatment of such diseases. Sequences appr3533-ADB75373 represent primary sequence and chaperone properties: HSP90, HSP70, HSP60 and sHSP (small heat shock protein). The invention is based upon the finding that among the sHSP family, which have a general structure of a central domain (called the alpha-crystallin domain) flanked by N and C-terminal regions, proteins and/or protein activities. Protein chaperones (also known heat shock proteins) are divided into 4 families on the basis of the The invention relates to a hybrid protein chaperone for stabilising members of the sHSP family which may be used in hybrid protein The invention is based upon the finding that chaperones

The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and fo

This protein os CC located in the eye lens, and also in striated muscle, kidney and CNS CC tissue. Within the normal CNS, alpha B crystallin is mainly found in CC oligodendrocytes located in the white matter. It has been shown that CALPHA B crystallin is highly homologous to heat shock proteins and has CC been found to exhibit chaperone characteristics. Immunohistochemical CC studies have shown that cellular levels of alpha B crystallin increase as CC a result of stress. Also in a number of pathological conditions, e.g. CC alzheimer's and Alexander's disease, levels of alpha B crystallin are CC elevated. Immunohistochemical staining of CNS tissues with anti-alpha B CC crystallin antibodies revealed enhanced expression within or close by CC multiple sclerosis (MS) lesions as compared to unaffected regions of CC white matter. Alpha B crystallin is thought to be the autoantigen in MS compared to the autoantigen in MS cand is is the target of various modifications, e.g. phosphorylation. There are only four amino acid differences between bovine and human alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel isolated gene sequence that is downregulated in the spinal cord of a mammal in response to mechanically distinct first and second models of neuropathic or central sensitisation pain, useful in the screening of compounds for diagnosting or treating pain. A protein encoded by a gene of the invention has analgesic activity. A polynucleotide of the invention may have a use in gene therapy. The gene sequence is useful for preparing a composition for diagnosing or treating pain. The present sequence represents a protein encoded by a gene of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                       and which has nootropic, neuroprotective, antiparkinsonian and anticonvulsant activity. The compositions are specifically used to treat or prevent Alzhaimer's, Pick's, Huntington's and Parkinson's diseases and also for diagnosis. DNA sequences that encode alpha-1-antitrypsin (aaT), or its fragments, are useful for isolating homologous RNA or DNA sequences, and for recombinant production of aaT in gene therapy. This sequence represents the mouse alpha-B cristallin alpha (SWISS PROT No: P23927) used in the composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            neuroprotective; antiparkinsonian; anticonvulsant; Alzheimer's Pick's disease; Huntington's disease; Parkinson's disease; alpha-1-antitrypsin; aaT; gene therapy; alpha-B cristallin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel composition for treatment or prevention of neurodegenerative disease containing at least one protease inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        especially alphal-antitrypsin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Composition for treating or preventing neurodegeneration, Alzheimer's or Parkinson's diseases, contains protease in

The stress protein can be used as a diagnostic agent for autoimmune dise. Antibodies raised against the protein can be used in immunoassays to detect the presence of the protein and in a new protein purification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New stress protein p20,

                                                                                                                                                                                                                                                                                                                                                                                                                      cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antimugal; antirheumatic; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency storage, systemic lupus crythematosus, severe combined immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant;

CC polypeptide, for stimulating mesenchymal cell growth and/or division by C exposing animal mesenchymal cells to conditioned media or its active CC fraction, obtained from deer antler cartilage cells, for inhibiting cell crowth and/or division by inserting into an animal cell, a compound which combine the translation of the polynucleotide encoding the DACC. The CC method and the polypeptides are useful for stimulating mesenchymal cell cc growth and/or division or for stimulating condrogenesis, cartilage, disc cor connective tissue growth, repair, regeneration and/or restoration in cc an animal. The polynucleotides, polypeptides, agonists and antagonists cm an animal in treatment modalities, specifically in gene therapy. The cc polypeptides can be used as bait proteins in a two- or three-hybrid assay considered in treatment modalities, specifically in gene therapy. The colypeptide and are involved in modulating cell growth and/or division. The sequences presented in ABG93923-ABG93948 are the proteins encoded by the DACC cDNA clones
                                                                                                                                                                                              Query Match

The chondrocytes selectively express genes required to form a cartilaginous matrix. The DACC polypeptides and polynucleotides are useful for identifying an agent that modulates the activity of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention discloses a method for stimulating or inhibiting cell growth and/or division which comprises contacting or inserting into an animal cell a polypeptide comprising one of the deer antler cartilage cell (DACC) clones disclosed. More particularly, the method relates to these polypeptides stimulating mesenchymal cell growth and/or division
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Stimulating or inhibiting cell growth and/or division, useful for stimulating chondrogenesis, cartilage, disc or connective tissue growth, repair, and/or regeneration, comprises administering deer antler

                                                                                                                                                                                                                                                                                                     vulnerary, neuroprotective, immunomodulator, cytostatic and anti-
inflammatory. Compositions comprising nucleic acids of the invention are
useful for treating a mammalian subject, or as nutritional sources or
supplements. These are useful in gene therapy, particularly for treating
wounds, burns or ulcers, Alzheimer's disease, Huntington's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides and their encoded proteins, useful as nutritional sources or supplements, or in gene therapy, particularly for treating wounds, Alzheimer's disease, amyotrophic lateral sclerosis, cancer or inflammation.
Sequence 160
                                                                amyotrophic lateral sclerosis, autoimmune disorders, cancer or inflammation. The nucleic acids and polypeptides are also useful in diagnostic and research methods. The sequences given in records ABP43544-ABP43989 represent polypeptides encoded by polynucleotides of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to 446 newly isolated polynucleotide sequences. The activity of polynucleotides of the invention may be described as,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 20; SEQ ID # 776; 357pp + Sequence Listing; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               뮍
             proteins or antibodies, their fragments or conjugates in an aqueous solution using hybrid protein chaperones; stabilised protein formulation comprising at least one protein associated with the above hybrid protein chaperone; nucleic acids and vectors encoding a hybrid protein chaperone, and the coexpression of a recombinant protein of interest and a hybrid protein chaperone. The hybrid protein chaperones are useful as agents to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New hybrid protein chaperone (e.g. heat shock protein) useful for stabilizing proteins and/or protein activities, or as an agent to prevent protein aggregation, or for treating diseases involving altered protein
                                                                                                                                                                                    region from a second SHSP can improve the activity compared to native SHSPs. In a particual embodiment of the invention, the hybrid chaperon is a hybrid SHSP designated alphaB-HSP27 comprising the N-terminus and central portion of alphaB-crystallin and the C-terminal tail of HSP27. However, the hybrid protein chaperones of the invention can comprise regions from HSP90, HSP70 and HSP60 families as well as from the sHSP
                                                                                                                                                                                                                                                                                                                                         primary sequence and chaperone properties: HSP90, HSP70, HSP60 and sHSP (small heat shock protein). The invention is based upon the finding that among the sHSP family, which have a general structure of a central domain (called the alpha-crystallin domain) flanked by N and C-terminal regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hybrid protein chaperone; protein stabilisation; heat shock protein; sHSP family; protein aggregation inhibition; cell death inhibition; genome stability pathway inhibition; protein denaturation identification; protein conformation related disease; cardiomyopathy; cataract; neurodegenerative disease; cardiant; ophthalmological; neuroprotective;
                                                                                                                                                such as enzymes,
                                                                                                                                                                                                                                                                                                                                                                                                                               proteins and/or protein activities. Protein chaperones (also known as heat shock proteins) are divided into 4 families on the basis of their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a hybrid protein chaperone for stabilising

                                                                                                                                                                                                                                     PTM: O-glycosylated; contains N-acetylglucosamine side chains.

PTM: IN LENS, MOST DEAMIDATION OF ASN-101 OCCURS DURING THE FIRST 30 YEARS OF AGE, FOLLOWED BY A SMALL ADDITIONAL AMOUNT OF DEAMIDATION (APPROXIMATELY 5%) DURING THE NEXT APPROXIMATELY 38 YEARS, RESULTING IN A MAXIMUM OF APPROXIMATELY 50% DEAMIDATION DURING THE LIFETIME OF THE INDIVIDUAL.

DISEASE: Defects in CRYAR are the cause of zonular central nuclear cataract [MIM:123580]. It is one of a considerable number of phenotypically and genotypically distinct forms of autosomal dominant cataract [MIM:604219]. This congenital cataract is a common major abnormality of the eye that frequently cause blindness in infants.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
